

NCV891130

Step-Down Regulator - Automotive, Low-Iq, Dual-Mode

1.2 A, 2 MHz

The NCV891130 is a Dual Mode regulator intended for Automotive, battery-connected applications that must operate with up to a 45 V input supply. Depending on the output load, it operates either as a PWM Buck Converter or as a Low Drop-Out Linear Regulator, and is suitable for systems with low noise and Low Quiescent Current requirements often encountered in automotive driver information systems. A reset pin (with fixed delay) simplifies interfacing with a microcontroller.

The NCV891130 also provides several protection features expected in automotive power supply systems such as current limit, short circuit protection, and thermal shutdown. In addition, the high switching frequency produces low output voltage ripple even when using small inductor values and an all-ceramic output filter capacitor – forming a space-efficient switching regulator solution.

Features

- 30 μ A Iq in Light Load Condition
- 1.2 A Maximum Output Current in PWM Mode
- Internal N-channel Power Switch
- VIN Operating Range 3.7 V to 36 V
- Withstands Load Dump to 45 V
- Logic Level Enable Pin can be Tied to Battery
- Fixed Output Voltage of 5.0 V, 4.0 V or 3.3 V
- 2 MHz Free-running Switching Frequency
- ± 2 % Output Voltage Accuracy
- NCV Prefix for Automotive Requiring Site and Control Changes
- These Devices are Pb-Free and are RoHS Compliant

Typical Applications

- Audio
- Infotainment
- Instrumentation
- Safety-Vision Systems

ORDERING INFORMATION

See detailed ordering and shipping information on page 13 of this data sheet.

The block diagram illustrates the internal architecture of the NCV891130, which is designed to manage power for a microcontroller and its peripherals. Key components and their interconnections include:

- Inputs and Outputs:** VIN (input voltage), CIN (input capacitor), DRV (driver output), VOUT (output voltage), COUT (output capacitor), EN (enable input), and RESET (reset input).
- Internal Blocks:**
 - Oscillator:** Generates a clock signal for the system.
 - PWM LOGIC:** Controls the switching of the power MOSFETs.
 - 1.2 A detector:** Monitors the output current for overcurrent protection.
 - TSD (Thermal Shutdown):** Protects the IC from overheating.
 - Soft-Start:** Controls the ramp-up of the output voltage during startup.
 - VOLTAGES MONITORS:** Monitor the input and output voltages for undervoltage lockout.
 - MODE SELECTION:** Configures the IC for different operating modes.
 - Logic:** Coordinates the overall power management logic.
- External Components:**
 - 3.3 V Reg:** A voltage regulator providing a stable 3.3V supply to the IC.
 - SW, BST, CBST, DBST:** Power MOSFETs and capacitors used in the switching stage.
 - L1:** An inductor used in the output filter.
 - DFW:** A diode used in the output filter.

APPLICATION INFORMATION

Hybrid Low-Power Mode

A high-frequency switch-mode regulator is not very efficient in light load conditions, making it difficult to achieve low-I_q requirements for sleep-mode operation. To remedy this, the NCV891130 includes a low-I_q linear regulator that turns on at light load, while the PWM regulator turns off, ensuring a high-efficiency low-power operation. Another advantage of the low-power mode is the tight regulation free of voltage ripple usually associated with low-I_q switchers in light load conditions. In either mode, the NCV891130 meets the 2% output voltage regulation specification.

At initial start-up the NCV891130 will soft-start into PWM converter mode regardless of output current. During a 300 s period, the NCV891130 will assess the level of output current. The NCV891130 will not make the assessment if RSTB is low. If the output current is above the I_{NtoL} threshold, the NCV891130 will stay in PWM mode. Otherwise, the NCV891130 will transition to low power mode.

It will stay in this low-power mode until the output current exceeds the I_{LIM} limit: it then transitions back to PWM converter mode. This low-power mode to PWM mode transition happens within 2 s. The transient response is not affected by the mode change.

Once the NCV891130 has transitioned to switcher mode, a 500 s blanking period will occur. After the blanking period, the NCV891130 will reassess the output current level. If the output current level is below the I_{NtoL} threshold, the NCV891130 will enter low-I_q mode. If the NCV891130 is in low-power mode and in normal battery range, it will transition to switcher mode when V_{IN} increases above V_{LINtoSW(HV)}, regardless of the output current. Similarly, if the NCV891130 is in PWM mode and V_{IN} is higher than

V_{FOLDUB} it will not transition to low-power mode even if the output current becomes lower than I_{NtoL}.

At low input voltage, the NCV891130 stays in low-power mode down to V_{LINtoSW(LV)} if it entered this mode while in normal battery range. However it may not enter low-power mode below 8 V depending on the charge of the bootstrap capacitor (see Bootstrap section for details).

Input Voltage

An Undervoltage Lockout (UVLO) circuit monitors the input, and can inhibit switching and reset the Soft-start circuit if there is insufficient voltage for proper regulation. Depending on the output conditions (voltage option and loading), the NCV891130 may lose regulation and run in drop-out mode before reaching the UVLO threshold: refer to the Minimum V_{IN} calculation tool for details. When the input voltage drops low enough that the part cannot regulate because it reaches its maximum duty cycle, the switching frequency is divided down by up to 4 (down to 500 kHz). This helps lowering the minimum voltage at which the regulator loses regulation.

An overvoltage monitoring circuit automatically terminates switching if the input voltage exceeds V_{OVSTP} (see Figure 29), but the NCV891130 can withstand input voltages up to 45 V.

To avoid skipping switching pulses and entering an uncontrolled mode of operation, the switching frequency is reduced by a factor of 2 when the input voltage exceeds the V_{IN} Frequency Foldback threshold (see Figure 29). Frequency reduction is automatically terminated when the input voltage drops back below the V_{IN} Frequency Foldback threshold. This also helps to limit the power lost in switching and generating the drive voltage for the Power Switch.

Figure 29. NCV891130 Switching Frequency Profile vs. Input Voltage

Soft-Start

Upon being enabled or released from a fault condition, and after the DRV voltage is established, a soft-start circuit ramps the switching regulator error amplifier reference voltage to the final value. During soft-start, the average switching frequency is lower until the output voltage approaches regulation.

Slope Compensation

A fixed slope compensation signal is generated internally and added to the sensed current to avoid increased output voltage ripple due to bifurcation of inductor ripple current at duty cycles above 50%. The fixed amplitude of the slope

compensation signal requires the inductor to be greater than a minimum value, depending on output voltage, in order to avoid sub-harmonic oscillations. The recommended inductor values are 2.2 or 3.3 μH , although higher values are possible.

Current Limiting

Due to the ripple on the inductor current, the average output current of a buck converter is lower than the peak current setpoint of the regulator. Figure 30 shows – for a 2.2 μH inductor – how the variation of inductor peak current with input voltage affects the maximum DC current the NCV891130 can deliver to a load.

Figure 30. NCV891130 Load Current Capability with a 2.2 μH Inductor

Short Circuit Protection

During severe output overloads or short circuits, the NCV891130 automatically reduces its switching frequency. This creates duty cycles small enough to limit the peak current in the power components, while maintaining the ability to automatically reestablish the output voltage if the overload is removed.

In more severe short-circuit conditions where the inductor current is still too high after the switching frequency has fully folded back, the regulator enters a hiccup mode that further reduces the power dissipation and protects the system.

RESET Function

The RSTB pin is pulled low when the output voltage falls below 7.5% of the nominal regulation level, and floats when the output is properly regulated. A pull-up resistor tied to the output is needed to generate a logic high signal on this open drain pin. The pin can be left unconnected when not used.

When the output voltage drops out of regulation, the pin goes low after a short noise-filtering delay (t_{filter}). It stays low for a 16 ms delay time after the output goes back to regulation, simplifying the connection to a micro-controller.

The RSTB pin is also pulled low immediately in case of VIN overvoltage, Thermal shutdown, VIN UVLO or DRV UVLO.

Feedback Loop

All components of the feedback loop (output voltage sensing, error amplifier and compensation) are integrated inside the NCV891130, and are optimized to ensure regulation and sufficient phase and gain margin for the recommended conditions of operation.

Recommended conditions and components:

- Input: car battery
- Output: 3.3 V, 4 V or 5 V, with output current up to 1.2 A
- Output capacitor: one to three parallel ceramic 10 μF capacitors
- Inductor: 2.2 μH to 3.3 μH

With these operating conditions and components, the open loop transfer function has a phase margin greater than 50°.

NCV891130

Bootstrap

At the DRV pin an internal regulator provides a ground-referenced voltage to an external capacitor (C_{DRV}), to allow fast recharge of the external bootstrap capacitor (C_{BST}) used to supply power to the power switch gate driver. If the voltage at the DRV pin goes below the DRV UVLO Threshold V_{DRVSTB} , switching is inhibited and the Soft-start circuit is reset, until the DRV pin voltage goes back up above V_{DRVSTT} .

The NCV891130 permanently monitors the bootstrap capacitor, and always ensures it stays charged no matter what the operating conditions are. As a result, the additional charging current for the bootstrap capacitor may prevent the regulator from entering Low- I_q mode at low input voltage. Practically, the 5 V output version does not enter Low- I_q

mode for input voltages below 8 V, and the 4 V version for input voltages below 6.5 V (see typical characteristics curves for details).

Enable

The NCV891130 is designed to accept either a logic level signal or battery voltage as an Enable signal. However if voltages above 40 V are expected, EN should be tied to VIN through a 10 k Ω resistor in order to limit the current flowing into the overvoltage protection of the pin.

EN low induces a shutdown mode which shuts off the regulator and minimizes its supply current to 9 μ A typical by disabling all functions.

Upon enabling, voltage is established at the DRV pin, followed by a soft-start of the switching regulator output.

Buyer is responsible for its products and applications using **onsemi** products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by **onsemi**. "Typical" parameters which may be provided in **onsemi** data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. **onsemi** does not convey any license under any of its intellectual property rights nor the rights of others. **onsemi** products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use **onsemi** products for any such unintended or unauthorized application, Buyer shall indemnify and hold **onsemi** and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of the part. **onsemi** is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
